

Simulated Traffic Motion Plots (no conflict resolution)

**R. A. Paielli
NASA Ames Research Center**

The following plots show time steps of a simulated traffic scenario. Stepping through the stack of plots simulates a “movie” that can be viewed in discrete time steps. The subtitle of each plot shows the frame number followed by the time of day and the number of flights active at that time.

Each green oval represents the buffered bounding area for a flight. To reduce clutter on these busy plots, the bounding areas (which are shown as red rectangles on other plots) are not shown. The ovals touch when the horizontal separation of the bounding areas is 3 nmi (nautical miles). If two ovals do not overlap, the horizontal separation exceeds the standard of 3 nmi. If they overlap, the separation may or may not be sufficient, depending on the vertical separation. When separation is insufficient, the buffered bounding areas are shown in red.

Depending on the particular use for these plots, flight labels and altitudes could be added, but then the plots become more cluttered. These plots could perhaps be more useful if a pdf viewer could zoom in on a particular area of each plot and step to the same area with each page advance, but I have not been able to achieve that capability. These plots are a work in progress.
