

Plots of Arrival Reroute Maneuver Candidates for Conflict Resolution

**R. A. Paielli
NASA Ames Research Center**

The following plots show arrival reroute maneuver candidates for conflict resolution. In these plots, all maneuvers are computed and assigned shortly before entry into the TRACON airspace. The original route for each flight is shown as a dashed blue line, and the reroute candidates are shown as solid gray lines. The red dashed rectangle around DFW airport is a restricted zone (that was defined for this study) to keep DAL flights from getting too close to DFW.

The candidate routes are generated by permuting each of three parameters through a set of values. The three parameters are: (1) the initial turn angle, (2) the length of the leg following the turn, and (3) the length of the final approach leg. Routes that have turn angles greater than a specified threshold are rejected, as are routes that exit the TRACON boundary, or DAL arrivals that enter the restricted space around DFW airport. The resulting number of candidate routes is shown in the subtitle. The resulting delay is computed for each candidate, and the one with the least estimated delay is selected from those that resolve the conflict, if any do.

The altitude and along-track distance plots that follow the route plots were used to help verify correctness of the rerouting algorithm. The original altitudes and along-track profiles are shown in a wide black line, and the values for the rerouted trajectories are shown in red. The fact that they are the same shows that the longitudinal profiles of the rerouted trajectories are identical to the original for its entire length, as they should be.
